

Workflow: Today vs Proposed

Today: three separate UIs, no shared unit

moderator manually re-establishes context across tabs → slow, error-prone, hard to measure

Proposed: one Moderator Workbench — primary object = candidate bout

KPI1 time-to-notification ↓ · KPI2 % moderated ↑ · KPI3 accuracy ↑ · KPI4 granularity ↑ · KPI6c moderators ↑

Cross-node "heard at N sites" flag (#584) · dev-mode auth + JSON seed for local onboarding (#620)

Who and What Overlay Layers

Main overlay · sonogram bursts always visible · tags are empty boxes drawn around them

Layers (both on)

What · signal type = **outline color**

Who · source = **outline** (solid human · dashed model · dotted unknown)

Lower bars grouping

by Who

by What

Lower bars — grouped by Who (toggle above)

• A · human

• B · model

Tag box = empty outline around the burst (waveform stays visible)

Color = signal type

Source = solid / dash / dot

Corner state:

☐ unmoderated

☒ **confirmed**

☐ false positive

☐ **? needs confirmation**

...toggle → lower bars grouped by What (species)

Humpback

Transient

Vessel

Reads like the real site

The sonogram's bursts are always shown; a tag is an empty rectangle around a burst, so the waveform stays visible. Two species in one timeframe = two overlapping boxes.

Same marker everywhere: color = signal type, outline = source, corner glyph = moderation. Toggle regroups lower bars (Who ⇌ What) — upper tags are unchanged.

Approve

Change label

Approve/Change → confirmed + authoritative ✓

Block legend · color = signal type

□

□

□

source: human / model / unknown

corner: □ unmoderated · ✓ confirmed

× false positive · ? needs confirmation

Confirmation is authoritative. Later reporter/model input is preserved as a separate proposal for reconciliation.

Select one or many → Listen → Tag → Approve. Batch-approve consecutive signals. Every decision writes to the main database (detection/annotation reviews) — no side store.

Downstream effects

• Label change: atomically update affected bouts (split / merge / resize). Approval alone preserves membership and boundaries.

• Write a model-feedback row (approve / change label) for retraining & eval; withhold “unknown” (open issues U-1...U-7).

drag thumb to seek

While scrubbing

- Zoom in/out changes the span (10 s ↔ 1 h); the playhead stays put.
- The current selection and its tag draft persist across scrub/zoom.
- Confirmed blocks stay authoritative ✓ — scrubbing never edits them.
- Audio around the playhead is prefetched for instant playback.

Selection → action

Select one/many blocks (drag marquee, shift-click, or “all in view”).

▶ Listen (scoped/sequential)

Tag: transient ▾

Approve all

→ authoritative ✓

Drag the window (or its edges) to move/resize the visible span — no zoom loss

Playhead seeks audio in sync — drag it, drag the thumb, tap the spectrogram, or ⏮/⏭ arrow keys.
