

Workflow: Today vs Proposed

Today: three separate UIs, no shared unit

moderator manually re-establishes context across tabs → slow, error-prone, hard to measure

Proposed: one Moderator Workbench — primary object = candidate bout

KPI1 time-to-notification ↓ · KPI2 % moderated ↑ · KPI3 accuracy ↑ · KPI4 granularity ↑ · KPI6c moderators ↑

Cross-node "heard at N sites" flag (#584) · dev-mode auth + JSON seed for local onboarding (#620)

Who and What Overlay Layers

Main overlay · sonogram bursts always visible · tags are empty boxes drawn around them

Layers (both on)

What · annotation label (color)

Who · source (outline pattern)

Lower bars grouping

by Who

by What

Lower bars — grouped by Who (toggle above)

• A · human

• B · model

Tag box = empty outline around the burst (waveform stays visible)

Color = annotation label

Source = solid / dash / dot

Corner state:

☐ unmoderated

☒ confirmed

☐ false positive

☐ needs confirmation

...toggle → lower bars grouped by What (species)

Humpback

Transient

Vessel

Reads like the real site

The sonogram's bursts are always shown; a tag is an empty rectangle around a burst, so the waveform stays visible. Two species in one timeframe = two overlapping boxes.

Same marker everywhere: color = annotation label, outline = source, corner glyph = moderation. Toggle regroups lower bars (Who $\rightleftharpoons$ What) — upper tags are unchanged.

Moderator Workbench - Mobile

Option M1: Toggleable Lanes

Option M1 · status fill on toggleable lanes (evolutionary)

Toggle lanes by source or annotation label. State fill + corner glyph stay attached to each annotation.

Reporting source Annotation label

Moderation state stays stable when lanes toggle

☐ unmoderated ☒ confirmed ☒ false positive ☐ needs confirmation

Lane mode supplies source or annotation label; no duplicate label indicator.

Fill and glyph persist across regrouping.

Trade-off (M1 con)

Cheapest to build and reuses muscle memory. The active lane mode shows either source or annotation label, so comparing both dimensions requires toggling. State remains stable, and mixed-species overlap becomes structural when annotation-label lanes are selected.

Option M2: Species-first Overlay

Option M3: Layered Canvas

Option M3 · layered canvas — switchable pivot + facet toggles + minimap

Primary pivot

Reporter

Species

Moderation state

Facets

confirmed

unmoderated

false positive / needs confirmation

minimap · off-screen ↗

Confirmed ✓

Unmoderated □

Needs confirmation ?

07:55

08:05

08:15

Facets hide/show annotation classes (here: false positives are off) so the canvas stays readable while keeping data underneath.

One control switches the primary pivot — Reporter | Species | Moderation state — reusing the \$4.0 toggle, extended with a third option.

Minimap ribbon surfaces changes that are off-screen (↗), so alerts are discoverable without scrolling the whole session.

Most flexible — highest cost

Supports all three needs (state · species · alerts) and future facets (confidence, call-type) by adding toggles, not redesigns. Trade-off: complexity and discoverability — needs strong defaults or two moderators see different views.

Change labels

Confirm/Change → annotation authoritative ✓

Annotation legend · color = label

□

□

□

source: human / model / unknown

corner: □ unmoderated · ✓ confirmed

× false positive · ? needs confirmation

Confirmation is authoritative. Later reporter/model input is preserved as a separate proposal for reconciliation.

Select annotations → Listen → Tag → Confirm. Confirm multiple consecutive intervals. Writes annotation reviews to the main database; bout approval stays separate.

Downstream effects

• Label change: atomically update affected bouts. Confirming existing annotation tags preserves boundaries.

• Write model feedback (confirm / change label) for retraining; bout approval remains a separate action.

drag thumb to seek

Drag the window (or its edges) to move/resize the visible span — no zoom loss

Playhead seeks audio in sync — drag it, drag the thumb, tap the spectrogram, or ⏮/⏭ arrow keys.

✓

□

□

×

?

selection kept while scrubbing

While scrubbing

- Zoom in/out changes the span (10 s ↔ 1 h); the playhead stays put.
- The current selection and its tag draft persist across scrub/zoom.
- Confirmed blocks stay authoritative ✓ — scrubbing never edits them.
- Audio around the playhead is prefetched for instant playback.

Selection → action

Select one/many annotations (drag marquee, shift-click, or “all in view”).
